Dear Production Department:

We are herewith requesting that the Well Completion Form ACO-1 and attached information for the subject well be held confidential for a period of two years.

Should you have any questions or need additional information regarding subject well, please contact our office.

Respectfully,
ALAN THROWER

Redland Resources, Inc.

GEOLOGICAL REPORT

NUSS 13-7

SECTION 13 – T23S – R25W

HODGEMAN COUNTY, KANSAS

INTRODUCTION

The above captioned well was drilled to a total depth of 4,950 feet on July 25, 2011. A one-man logging unit was on location from approximately 1,000 feet monitoring gas, with sample examination beginning at 4,000 feet to TD. The well was under the geological supervision of the undersigned from approximately 4,300 feet to TD. At TD, Weatherford electric logs were run that consisted of Dual Induction, Compensated Neutron-Density, Sonic and Micro-log. From data collected while drilling and analyzing, there were no economic shows of hydrocarbons. The decision was made to plug and abandon the Nuss 13-7 as a dry hole.

INOLA LIMESTONE

The Inola was cut at 4,705 (-2225) feet. Samples were described as cream to tan, light gray fine crystalline predominately "tight" limestone with some bright yellow mineral fluorescence being observed. No other hydrocarbon shows were observed. A detrital zone above the Mississippian Unconformity was also cut. This zone gave up a slight brown dead oil staining along chert edges. A drill stem test was run to further evaluate these two zones, with results as follows; DST #1 (4648 – 4735)

Recovery: 15' oil cut mud; 1% oil

Flowing pressures: 19-22/22-23

Shut-in pressures: 832/362

The combined two zones tested "tight" and would not be productive of economic quantities of hydrocarbons.

(subsea)	(-2143)	(-2140)
MISS UNCON.	4736	4730
(subsea)	(-2256)	(-2253)

MISSISSIPPIAN

The top of the Mississippian was found at 4,736 (-2256) feet. Samples were described as white, cream, tan predominately "tight" limestone, with very low visible porosity and no hydrocarbon shows. A total of approximately 75 feet of hard limestone was cut before the first good dolomite section was cut.

CONCLUSION

The Nuss 13-7 was drilled as an exploratory test for a seismic "high". The high was encountered, but the Inola was "tight" and the Mississippian was encountered with a thick portion of "caprock" before the dolomite porosity was cut. The Nuss 13-7 was plugged and abandoned as a dry hole.

Respectfully submitted,

Mike Pollok

Petroleum Geologist
