Overland Park, Kansas 66204

Gentlemen:

Enclosed herewith is the report of the analysis of the rotary core taken from the Nolin Lease, Well No. 24, located in Linn County, Kansas and submitted to our laboratory on October 28, 1982.

Your business is greatly appreciated.

Very truly yours,

OILFIELD RESEARCH LABORATORIES

GENERAL INFORMATION & SUMMARY

Company Triple-I Energy Corporation Lease Nolin Well No. 24

Location

Section 23 Twp. 19S Rge. 22E County Linn State Kansas

Elevation, Feet	
Name of Sand	Bartlesville
Top of Core	621.0
Bottom of Core	631.0
Top of Sand	621.6
Bottom of Sand	631.0
Total Feet of Permeable Sand	6.3
Total Feet of Floodable Sand	5.3

Distribution of Permeable Sand: Permeability Range Millidarcys	Feet	Cum. Ft.
0 - 5	2.0	2.0
60 - 103	2.7	4.7
145 - 164	1.6	6.3

Average Permeability Millidarcys	79.4
Average Percent Porosity	21.4
Average Percent Oil Saturation	40.7
Average Percent Water Saturation	36.1
Average Oil Content, Bbls./A. Ft.	679.
Total Oil Content, Bbls./Acre	4,277.
Average Percent Oil Recovery by Laboratory Flooding Tests	12.0
Average Oil Recovery by Laboratory Flooding Tests, Bbls./A. Ft.	211.
Total Oil Recovery by Laboratory Flooding Tests, Bbls./Acre	1,116.
Total Calculated Oil Recovery, Bbls./Acre	See "Calculated Recovery" Section

The core was sampled and the samples sealed in plastic bags by a representative of the client. Air and KCl were used as drilling fluids. The core was reported to be from a non-virgin area.

FORMATION CORED

The detailed log of the formation cored is as follows:

Depth Interval, Feet	Description
621.0 - 621.6	Gray shale.
621.6 - 622.0	Brown sandstone.
622.0 - 622.2	Gray shale.
622.2 - 723.5	Brown sandstone.
623.5 - 626.4	Gray shale with widely scattered brown sandstone partings.
626.4 - 629.0	Brown sandstone.
629.0 - 631.0	Brown shaly sandstone with scattered micaceous partings.

LABORATORY FLOODING TESTS

The sand in this core responded to laboratory flooding tests, as a total recovery of 1,116 barrels of oil per acre was obtained from 5.3 feet of sand. The weighted average percent oil saturation was reduced from 42.2 to 30.2, or represents an average recovery of 12.0 percent. The weighted average effective permeability of the samples is 6.53 millidarcys, while the average initial fluid production pressure is 22.9 pounds per square inch (See Table V).

By observing the data given in Table IV, you will note that of the 8 samples tested, 7 produced water and oil. This indicates that

approximately 88 percent of the sand represented by these samples is floodable pay sand.

CALCULATED RECOVERY

It would appear from a study of the core data, that efficient primary and waterflood operations in the vicinity of this well should recover approximately 2,140 barrels of oil per acre. This is an average recovery of 403 barrels per acre foot from 5.3 feet of floodable sand analyzed in this core.

These recovery values were calculated using the following data and assumptions:

Original formation volume factor, estimated	1.05
Reservoir water saturation, percent, estimated	20.0
Average porosity, percent	22.6
Oil saturation after flooding, percent	30.2
Performance factor, percent, estimated	50.0
Net floodable sand, feet	5.3
