Re: Your No. 6 Warren
Sec. 1-35S-1E
Sumner County, Knsas

Gentlemen:

Enclosed is my geological log on the No. 6 Warren. On the log is all geological data collected during the drilling and testing of this well. It ran slightly higher than the other wells on the lease. Below is summarized my opinion of the known prospective reservoirs on the lease:

Stalnaker - this sand did not develop as it did in No. 3, and no reservoir is present.
Layton - 2849 - 83. this sand had shows of oil in about the top 10 feet, but some of that was a dark, watery stain. Only the very top is prospective.
Cattleman - 3431 - 46 - this sand had dull fluorescense, free oil, and gas throughout. It should be perforated before abandonment.
Mississippian - 3504 - 13. There were excellent shows of oil here throughout the porous zone (see DST report on log). Casing is set for production.

All tops, zones, etc. listed are subject to log depth correction.

Sincerely,

F. W. Morgan
