Re: No. 7 Warren
Sec. 1-35S-1E
Sumner County, Kansas

Gentlemen:

Enclosed is my geological log on this well. Plotted on the log are all pertinent geological data gained from the drilling of this well. This well ran about half way between the Warren No. 1 and the Jochems No. 2 in structural position on the top of the Mississippian. This means it is higher than the Warren well and lower than the Jochems well.

Unfortunately, the porosity in the Mississippian Chert formation was found 19 feet below the top of the Chert. In the Warren and the Jochems the porosity was much nearer the top. However, the samples had free oil, odor, and visible pinpoint porosity. The electric log showed fairly low porosity through the zone.

No shallower formation had any commercial shows of oil, but it was decided to run casing and test the Mississippian Chert.

Sincerely,

F. W. Morgan
