Mr Bill Chew
Bill Chew Inc.
2210 Dover Drive
Hutchinson KS 67502

Dear Mr Chew;

The # 1 Teichman was under my Geological supervision from a depth of 3100' to 3683' total depth. Samples were examined with Black light and Microscope from a depth of 3100' to a total depth of 3683'. Shows of oil was observed in the Arbuckle Dolomite, however Drill Stem Testing condemmed this zone.

Elevations

STRUCTURAL COMPARSION

Formation	Chew Teichman	Wildcat Brensing
Heebner	-1276	-1281
Brown Lime	-1414	-1419
Lansing	-1432	-1440
Viola	-1698	-1702
Simpson Shale	-1746	-1751
Arbuckle Dolomite	-1802	-1806

SAMPLE DESCRIPTIONS

ARBUCKLE DOLOMITE 3679/3683

Dolomite, tan with a good stain, trace white chert, some oolcastic, fair odor and fluorsence, no free oil.

DST # 1 3603 – 3683
Tester report attached .

There were no other zones in the subject well that were found to warrant testing.

RECOMMENDATIONS & CONCLUSIONS

Structurally, the # 1 Teichman ran four to five feet high to the show hole, # 1 Brensing located South of the subject well on all formations. The quality of the "Rocks" from the Lansing/Kansas City and Arbuckle dolomite were inferior to the Brensing # 1.

After careful examination of the data obtained from samples and the negative results of the drill stem test the # 1 Teichman was plugged at a total depth of 3683'.
