Memorandum

RE: Jay Boy Oil Company

Plugging Procedures
Hay #1 - SW NE NW 36-28-1W
Sedgwick County, Kansas

After logging was completed on the well, the drill pipe was run back into the hole, open ended to 3639'. At 3639' the well bore was reconditioned by circulating drilling mud for approximately two hours.

Halliburton Cementing Company arrived on location at approximately 1100 hours and plugging operations began.

A 50 sack cement plug was spotted at 3639', to isolate both the Simpson and Maquokta formations. The cement plug was displaced with drilling mud for a balanced plug.

The drill pipe was pulled to 375' for the top plug. At 375', cementing operations began by circulating cement back to surface. At 1500 hours, Halliburton had pumped 150 sacks of cement, with no cement returns to surface. An additional 100 sacks of cement was ordered to complete plugging operations.

After a waiting period of two hours, a wire line was run into the well bore to find the top of the cement. The cement was found at 155'. The drill pipe was run back into the well bore to circulate cement back to surface. An additional 80 sacks of cement was needed to bring cement returns to surface. The drill pipe was pulled from the well bore and topped off with five sacks of cement.

The rat hole was plugged by pumping 15 sacks of cement through a joint of drill pipe and circulated back to within 3 feet of surface.

The plugging operation was completed on 1/10/90 at 1915 hours.

Drilling mud weight 9.5#/gal.
Drilling mud viscosity, 48.
