

Reid,

These are my estimates on what flow facies are present. I have enclosed a quick lithologic log with facies color-coded as follows.

Facies 1 - coarse-grained sandstone with mudclasts and common cross-bedding. Rare shale breaks

Facies 2 - black shale, to finely interbedded black shale and siltstone.

Facies 3 - Very coarse-grained sandstone with rare mudclasts.

I hope this helps, or a bare minimum doesn't hinder.

Horizontal plugs have been taken of WMS 1105, however, we do not have a record of it. You may wish to contact Cities Services to see what they know

Stephen T. Franklin

Please, remember to mail back these sheets as they are my record of this core too. Plus, the vertical plugs and the data.

Thank You.
