Cable Tool Well

Pennsylvanian

Pennsylvanian basal conglomerate top 3600 feet

3600-3613 feet

Subsea -1533 feet

Subsea -1533 feet

Dark red and some white and various-colored chert.
Some red sandy clay and loose rounded sand grains.

This chert is largely derived from Galena, but one or two pieces of oolitic chert were noted. If this oolitic chert is derived from the Arbuckle, it is highly probable that Arbuckle will be found immediately underlying the conglomerate.
