02 – 3802 RE: Westport Oil & Gas

Dear Jim,

Please find enclosed production & GOR test calculations on the following new well operated by Westport Oil & Gas in Stevens Co, KS.

Well

Ruella Potts # 3

660 FNL & 660 FEL NE/4 Sec. 13 - 31S - 35 W

Westport is calling this producing zone the Kansas City - Lime.

This is a still flowing well since completion. Current production figures would show this well to classified as a gas well, however a multipoint would not be feasible with liquid amounts being produced. Also, if well were to be shut in for a 72 hr. rock pressure, would the well be able to start flowing without help of a swab unit. Should pumping equipment be installed and well still proves to be a gas well, a multipoint at that point in time may be feasible. Past production history has shown that the well at times shows more daily oil production than indicated on the enclosed test. At times 10 — 12 BOD with less gas.

Very truly yours,

Ted G. Ipson

Owner - Lone Eagle Testing
